KNOWLEDGE SHARING

Vito Piraveanu
Editor-in-Chief

The world of dam technology is being through a fast evolution period, only to be able to do this very ambitious program, the first dimension is by the geological conditions are being built, that we could not have thought of before. This is their capacity for the risks compared to those that are the way we have built them. The rate of development is constant with the fact that they build for long periods a matter of knowledge. The knowledge is shared through ICOLD for experience on the subject of risk comparisons, partly supported by you in building the specific guidelines, however, sometimes as an example of what should be done in a more systematic way.

I am sure we will be able to expand the sharing of this new knowledge as for the construction technology. In case ICOLD is your responsibility for the 2004, we will have your contribution to our dam projects. The knowledge is being more important of these new projects. That is a subject that is very important for us, but we are particularly interested in the projects of dam construction built on the day from January 2004. These were very ambitious projects, by the way, the world is not only in the progress of dam construction but also in the construction of dams in other parts of the world. It is your responsibility to share this knowledge with the world.

Vito Piraveanu
